

## Séminaire SOLEIL

# Amphiphilic and acidic $\beta$ -sheet peptides ; from design at nanometer scale to functional biomaterials

## Hanna RAPAPORT

(Department of Biotechnology Engineering and the Ilze Katz Institute for Nanoscale Technology,  
Ben-Gurion University of the Negev, Beer-Sheva, ISRAEL)

Invitée par Philippe FONTAINE

Mardi 25 février à 11h30  
Grand Amphi SOLEIL

Séminaires

The interest in advancing our abilities to fine-tune molecular systems, with precisely engineered molecular properties, is common to researchers studying nanostructured bio- and other materials. Based on progress in understanding protein structure and activity at nanometric-scale resolution various polypeptide biomaterials have been designed.

In our studies we utilize mainly amphiphilic and acidic  $\beta$ -sheet peptides, designed in bottom-up approach, to form self assembled ordered monolayers at air water interface, and fibrillar structures and hydrogels in solutions.

Structural analysis revealed that these peptides form two-dimensional crystals that may undergo elastic bending deformations, at the level of the unit cell, under two-dimensional isotropic stresses applied on monolayers films.[1,2] These  $\beta$ -sheet structures have been utilized as templates for studying heterogeneous nucleation of calcified minerals.[3]

The peptides may be triggered to generate self-supporting hydrogels at near neutral pH values relevant for various biological applications. The hydrogels may be tailored to efficiently deliver drugs and better mimic bone extracellular matrix.[4,5]

Functionality was also demonstrated in  $\beta$ -sheet monolayers which were designed to enhance adsorption of solutes towards biosensors applications.[6]
